

Viburcol®

Children get infections especially easily. Over 80% of all childhood illnesses are due to infections. The average child receives anti-infective medication twice per year.

Viburcol is a homeopathic combination formula with the healing properties of Chamomilla, four other plants, and one mineral to ensure an effective therapy without stressing the sensitive body of a child. A suppository dosage form is highly suitable for infants and circumvents the problems most children have with taking tablets.

Treatment Guidelines

Age

There are no age restrictions for administering Viburcol suppositories. Viburcol suppositories may be administered immediately after birth.

Fever

Treatment with Viburcol suppositories will not reduce fever dramatically. This allows continuance of one of the body's vital defense mechanisms. Fever will subside gradually due to alleviation of the underlying condition.

Easy to Use

Dosage recommendations

| | During acute phase | After alleviation of acute phase |
|---------------------------------|--------------------------------------|----------------------------------|
| Up to six months old | 1 suppository, maximum 2 times daily | 1 suppository daily |
| More than six months old | 1 suppository, several times daily | 1 suppository 2–3 times daily |

Drug interactions

Viburcol suppositories are not known to interact with any other medication. Therefore, Viburcol is highly suitable for effectively treating the restlessness and irritability associated with an illness that is treated with additional medication.

Side effects, contraindications

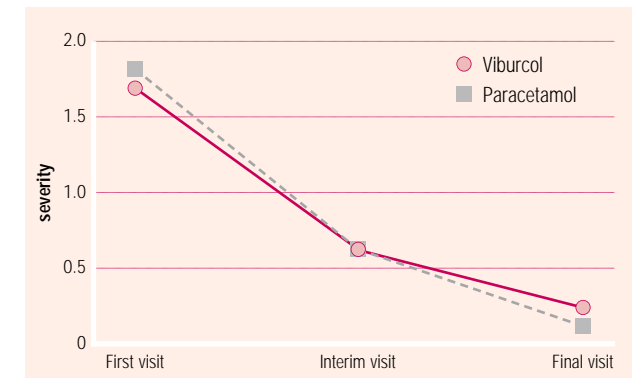

There are no known side-effects or contra indications associated with the use of Viburcol suppositories.

Demonstrated Efficacy

In a prospective, reference controlled cohort study¹⁾ children under 12 years were treated either with Viburcol (361 children) or with Paracetamol (406 children) in monotherapy. The overall efficacy of therapy was estimated as "very good" or "good" in 93% of the Viburcol patients.

A total of 87% of the children showed a significant reduction of symptoms within 3 days when treated with Viburcol.

Treatment with Viburcol at the recommended dosage reduces the severity of the primary symptoms of restlessness, fever and common feverish infections:

Score range: none = 0, slight = 1, moderate = 2
